VOHRA WOUND PHYSICIANS

REVOLUTIONIZING WOUND CARE

Enhancing Healing & Reducing Infection Risks with Vohra's **Bacterial Fluorescence Wound Imaging Program**

Every year, thousands of patients suffer complications from chronic wounds—many of which could be prevented with better detection tools. Traditional wound assessment methods often miss bacterial infections, delaying effective treatment and increasing costs.

BACTERIAL FLUORESCENCE WOUND IMAGING WITH MOLECULIGHTDX™

Our clinicians use fluorescence imaging technology to help improve patient outcomes and reduce healthcare costs.

Earlier Detection

Fluorescence imaging identifies bacterial load sooner than traditional methods.[2]

Faster Healing

Up to 70% more wounds healed in 12 weeks with fluorescence imaging (38.5% vs. 22.5%)[1]

Reduced Complications

Infection-related complications drop by 75%[1]

Antibiotic Stewardship

44% reduction in systemic antibiotic use, shifting toward more effective topical treatments.[1]

BENEFITS

Fewer Hospitalizations
Reduces costs & patient risks.

Lower Staff Workload
Faster recovery means less time spent on wound care.

Cost-Effective Treatment
Decreases supply and medication expenses.

RECOMMENDED FOR

- Initial wound assessments
- Clinical signs of infection
- Stalled wounds
- Worsening wounds
- Complex wounds
- Prior to use of grafts/ substitutes
